«We have just started using the CryoPen over the last month. Had a really good result on the stalk of an ear tumor last month, and has healed well without any regrowth.»

DVM
MUNICH, GERMANY**

«Neoplastic and benign cutaneous lesions are common in small animals. The reduced need for general anesthesia in older animals commonly affected with these lesions certainly is an advantage of cryotherapy. Most small cutaneous tumors can be treated rapidly, many on an outpatient basis. Two cases of anal adenoma responded well, giving complete resolution within 1 month. One of these cases had previously been treated unsuccessfully by surgical excision of the neoplastic tissue.

In 1 dog where both fore-feet had inter- and supradigital cysts of 2' years duration, complete resolution was obtained within 3 weeks of a single treatment by cryotherapy. Palliation and regression of a spindle-cell tumor on the gingival margin of a Fox Terrier was obtained.»

«In February 2014 Palm Gardens Veterinary Clinic acquired a CryoPen mainly for reducing small lumps and warts which are common in canines.

It has a great advantage in treating geriatric pets where anesthesia is a risk, and especially where small lumps occur on the face.

We have used it once in a cat with SCC on the ear where it caused reduction of a large tumor. This extended the cat's life although the cancer was too aggressive to be treated with CryoPen alone.

We recommend it as an adjunct to surgical therapy and the owners are happy as it is a cost-effective method of treating many small tumors.»

«La CryoPen è un'ottimo strumento per la crioterapia da effettuare in ambulatorio senza ausilio di anestesia generale o sedazione. Il trattamento è ben tollerato dall'animale, non comporta sanguinamento, né applicazione di punti di sutura e può essere effettuato in presenza del proprietario. Questo aspetto migliora sicuramente la "compliance", molti proprietari acconsentono alla crioterapia, mentre non sono favorevoli ad una terapia chirurgica tradizionale.

Impiego comunemente la CryoPen per il trattamento di piccole neoplasie sebacee della cute o delle palpebre, di carcinomi in situ, della distichiasi palpebrale, di fistole perianali e di adenomi delle ghiandole epatoidi.

La crioterapia è un metodo molto pratico, veloce e sicuro, pochi secondi di applicazione permettono di trattare lesioni a profondità variabili da 1 a 7 mm . e non comportano l'uso di antibiotici post-applicazione.»

The CryoPen is an excellent tool for cryotherapy to be performed in an outpatient clinic without the aid of general anesthesia or sedation. The treatment is well tolerated by the animal, does not involve bleeding, nor the application of stitches and can be performed in the presence of the owner. This aspect certainly improves «compliance», many owners agree to cryotherapy, while they are not in favor of traditional surgical therapy.

I commonly use the CryoPen for the treatment of small sebaceous neoplasms of the skin or eyelids, carcinomas in situ, palpebral distichiasis, perianal fistulas and adenomas of the hepatoid glands.

Cryotherapy is a very practical, fast and safe method, a few seconds of application allow you to treat lesions at depths ranging from 1 to 7 mm. and do not require the use of post-application antibiotics.
